Here is my code : fun checkNetwork() = CoroutineScope(Dispatchers.Default + Dispatchers.IO).launch { println("Checking network") val client = OkHttpClient() client.newCall(Request.Builder().url("").build()).enqueue(object : Callback { override fun onFailure(call: Call, e: IOException) { println("ERR") } override fun onResponse(call: Call, response: Response) { println("RESPONSE : \${response.body().toString()}") } }) } This will simply execute the request, print the results on the console and exit. Multi-drug-resistant bacteria are a severe threat to patients, even in hospitals, and a clear need exists for new therapeutic alternatives. Photodynamic inactivation (PDI) is one such alternative, and several studies have demonstrated that PDI is effective in killing a wide range of microorganisms, including multi-drug-resistant bacteria. In this work, we evaluated the efficacy of PDI as a therapeutic alternative in comparison with the conventional antibiotics to treat multi-drug-resistant *Pseudomonas aeruginosa* and *Staphylococcus aureus*, and compared the efficacy with a new oxygen independent photosensitizer named SING (Chen et al., 2008). In order to better understand the mechanism of PDI action, we also evaluated the survival of *P. aeruginosa* and *S. aureus* after PDI in a model consisting of bacterial aggregates. Our results demonstrate that PDI is effective against both strains, and its efficacy is comparable to the antibiotics tested. As expected, our results showed that both bacteria aggregates are more resistant to PDI than the planktonic cells. In addition, PDI did not induce resistance to the treatment and bacteria were able to acquire resistance against PDI over a period of several months. Now that we've played with the tracking dots, the gamepad, the fov, the mouse, and even a 2.5-inch screen, we're about to have another go at a controller. It seems like it should be easy, but all the success of the first Project CARS is riding on the right combination of sense and sensibility. There are just so many different pieces, and it's our job to choose which pieces to work on. As soon as we knew what we wanted to go for with Project CARS 2, our next big focus was whether we were going to use a full six-axis controller, or if we'd settle for five axes. Obviously, we have to have six degrees of freedom to do everything we do, but it's a big question with a big impact. For the most part, when we talked about "input", we meant the existing six degrees of freedom. We know we'd like to add mouse movement and a three-axis screen, but we're starting with
