Since then, she has done similar work for family members, friends and a girl at her church. Kuehnert, who lives just outside Hoover, has made a variety of paper goods for friends and family for Christmas. Kuehnert says that she enjoyed designing things for her children and husband and she wants to pass that on to others. Description The most prominent feature of the deep downer is the ridge which runs through the heart of the ball. The ridge is flattened on both sides and has a great amount of unevenness in it. There is a slight high dimple near the center of the ball that is flattened out towards the bottom of the ball. The dimple can be considered to be fairly shallow when compared to the rest of the features on the ball. The dimple is able to retain less amount of water than the rest of the features of the ball. The rest of the dimples on the ball are deep and have a flatter side. They are aligned in a circular pattern around the center. The water resides in the dimples on the lower side of the ball. The middle of the ball has a small amount of dimples that reside in the middle. It is very important to note that this dimple is also flat.

Disposable versus reusable nasal irrigation: an evidence-based review. Nasal irrigation has long been recognized as a safe and effective means to treat and prevent bacterial and viral upper respiratory tract infections. The approach of irrigating the nasal cavity through the nose has been preferred for many years because it provides a focused solution for the nasal sinuses, rather than requiring the patient to hold a bulk volume of irrigant. In this review, evidence that the specific clinical outcome of treatment of the sinus cavities can be improved using either a disposable or reusable system is examined. A review of the literature was undertaken using PubMed, OVID, and Cochrane Library from the years 1966 to 2009, with the following search terms: "nasal irrigator," "disposable," "reusable," "nasal therapy," and "upper respiratory tract infection." Articles were evaluated for the purpose of answering the following questions: (1) Is there an advantage of one system over the other with regard to the clinical efficacy of treatment of the sinus cavities? (2) What is the effect on the physiology of irrigating the sinuses? (3) What is the effect on the microbiota of the sinuses? (4) What are the reported adverse effects? (5) What is the effect on the cost of irrigation? One article was excluded because it described the use of nasal irrigation as a method to ventilate the sinuses and did not relate it specifically to nasal irrigation. Nasal irrigation through the nose is a safe and effective way to treat and prevent upper respiratory tract infections. Clinicians should
