Tip Whenever you edit image layers, they are saved as either a non-destructive or a destructive edit. Non-destructive edits are made in the editing window (Figure 1-1), and the original image is retained until you either print or export the image. On the other hand, when you save the image after an edit, any

---

edits are applied. If you want to undo the changes, you must export the image from the software and then import the image into a graphic-editing application. Figure 1-1.

Layers are extremely useful for manipulating images. These layers were created in layers format in Photoshop. The original image file is in the main image window. To change the way you organize images, you can use groups (Figure 1-2) and align with the four corners.

You can also create custom commands to perform tasks that

---

change the way you work.")), which allow you to organize an image with as many or as few layers as you like.

A layer is the top layer in a group. Groups work much like folders in the Finder window. And like the Finder window, you can create folders inside folders to group your files by content. Figure 1-2. Layers are used to align objects with the four corners. A group is a convenient way to apply and organize layers. You can also create custom commands that change the way you work.

1. Field of the Invention The present invention relates to a method for forming a conductive portion of a semiconductor device such as a thin film transistor and a

---

semiconductor device. 2.

Description of the Prior Art A semiconductor device such as a thin film transistor (TFT) is required to be improved in various characteristics such as electric characteristics and resistance to chemicals. One of the characteristics thereof is electric characteristics of a conductive portion of the semiconductor device such as a source electrode. The conductive portion can be increased in resistance in case where a conducting layer is formed between

---

the conductive portion and an upper conductive layer. For example, as a forming method of the source electrode of the

FIG. 1 is a block diagram of the mixing of image signals in a conventional image forming apparatus. The image forming apparatus includes a document image scanner 1, a CPU unit 2, a printer controller 3, a printer 4, a display controller 5, and an LCD unit 6. When a user presses a button

---

on the LCD unit 6, an image signal read from the document image scanner 1 is transmitted to the printer controller 3. The printer controller 3 transmits print data to the printer 4 according to the received image data, and an image is printed on paper P by the printer 4. As shown in FIG. 2, the printer controller 3 includes a clock generation unit 31, a color conversion unit 32, a sub pixel modulation unit 33, a color space conversion unit 34, a modulation unit 35, a mixing unit 36, and a final

---

color processing unit 37. In addition, the display controller 5 includes a clock generation unit 51, a color conversion unit 52, a sub pixel demodulation unit 53, a color space conversion unit 54, a demodulation unit 55, a modulation unit 56, and a mixing unit 57. The clock generation unit 31 and the clock generation unit 51 convert the system clock of the CPU unit 2 into a sub clock. The color conversion unit 32 converts the image data into a color signal of a predetermined format such as CMYK and also

---

converts the data into a variety of resolutions such as CMYK (X), CMYK (X), CMYK (A4), CMYK (B4), CMYK (A3), and CMYK (B3). The sub pixel modulation unit 33 generates sub pixels for modulating the color signal according to the resolution. For example, the sub pixel modulation unit 33 divides the sub clock into four parts for generating four sub pixels for modulating the color signal in each line. The color space conversion unit 34 performs conversion of the color signal into

---

color spaces according to image scanning or printing. For example, when image scanning is performed, the color conversion unit 34 converts the image data from the color space of scanner into the color space of a predetermined printer. For example, when image printing is performed, the color conversion unit 34 converts the image data from the color space of the printer into the color space of a predetermined scanner. The modulation unit 35 modulates the converted color signal using each

---

sub pixel, and the modulation unit 35 comprises a mixing unit 36. The mixing unit 36 mixes two
