Good ratings and reviews for latest software releases.Q: How to use a multi-polygon function with information from a spatial line function? I am a bit of a noob to R and to GIS. I have two shape files; one is an area and the other is a list of long, lat coordinates. I want to check if any of the polygons in the area file intersect any of the points in the list file. I have made a function that can return a vector of the list file values within polygons of another shape file. I am thinking I have to use the SpatialLinesToRaster() and SpatialLinesToNDF() functions but I can't find how to incorporate the spatial line information with my non-spatial information.

```
library(sp) library(rgdal) ## Define variables areaFile
