It will be done Q: Is a vector composed of numbers an array or a list? What is the difference between a vector and a list? When is it appropriate to use one over the other and why? A: The difference is that the list is ordered (i.e. you can take the first element, then the second element, etc) and a vector is unordered (i.e. you can take the element at any location in the vector). So, for example, if you have a list: myList = [1,2,3,4,5] You can take the first, second, third, etc, elements. If you have a vector: myVector = [1,2,3,4,5] You can take any element at any position. Obviously, in a case like this, the list is a much more useful data structure since you can take the exact element you want. You can't do that with the vector. However, if you have an array: myArray = [1,2,3,4,5,6,7,8,9,10] Then you have to take a particular position (the indices are 0, 1, 2, 3, etc), and can't just take any element you want. A final note is that, as I wrote above, a list is ordered. A vector, however, is not. A vector is also, by default, a sequence. If you want to use a vector
